

Biological Approach

Personality shaped by
genetics and inherited
biological structures.

Humanistic Approach

Focuses on inherent human goodness and striving for self-actualization.

Behavioural Perspective

Behavioral patterns learned
entirely through external rewards
and punishments.

Social-Cognitive Theory

How mental processes and
social environments interact to
guide behavior.

Trait Theory

Views personality as a configuration of stable, measurable traits.

Erikson's Psychosocial Stages of Development

Eight lifelong developmental
stages centered on unique
psychosocial crises.

Temperament

Innate, biological tendencies
shaping how we emotionally react
and adapt.

Traits

Stable, enduring tendencies
to think, feel, and behave in
specific ways.

Personality

An individual's unique, enduring
pattern of thinking, feeling,
and acting.

Self-Concept

An individual's internal perception
and mental blueprint of who
they are.

Self-Efficacy

One's belief and confidence in
their own ability to succeed.

Archetypes

Universal, inherited symbols or themes within the collective unconscious.

Reciprocal Determinism

The continuous feedback loop
between thoughts, behavior, and
environment.

Congruence

A state of high alignment
between real self and ideal self.

Id

The unconscious mind
driven by primitive urges and
immediate pleasure.

Ego

The rational, conscious mind
balancing primitive desires
with reality.

Superego

The internalized moral conscience
tracking societal rules, ideals,
and guilt.

Locus of Control

Believing life's outcomes are driven by your actions versus external forces.

Defense Mechanisms

Unconscious mental strategies
used by the ego to distort reality
and reduce anxiety.

Projective Testing

Using ambiguous stimuli (like inkblots) to explore unconscious psychological processes.
